Water Car Review Site Launches

Learn how to convert your car to run on both water and gasoline with the water4gas system. Double your mileage, save money on gasoline prices, and drastically reduce emissions.

/24-7PressRelease/ - SYDNEY, AUSTRALIA, December 08, 2007 - Pkorbs today launched its water car review site <http://www.water4gasreview.com>. The mass production of complete and efficient water cars is some time off, however the recent development of the water4gas system has revolutionized energy efficient automobile modifications. The innovative water4gas system allows cars to run on both water and gasoline, which in turn can see users increasing their mileage by up to 50 %, save considerable amounts of money on gasoline costs, and significantly decrease emissions.

Gasoline is an exhaustible energy source, and prices will only increase til supply eventually runs out. The US is experiencing considerable gasoline price increases currently, as Barbara Hagenbaugh, contributor to USA Today states "Oil prices have risen approximately \$20 a barrel in the past two months. Retail gasoline costs have increased about 30 cents a gallon in that time. The agency's models suggest gas prices will likely rise another 20 cents in the next two or three weeks to fully reflect the jump in oil costs". This is a frightening statistic, and the outlook is bleak for those who are heavily reliant upon their vehicles.

The water4gas system is essentially a blueprint which shows how anyone can safely and easily assemble an apparatus which compliments and assists engine combustion. The parts required are readily available from any hardware store. At the core of the water4gas system is the production of HHO Gas (Hydrogen + Oxygen) which is directed into the engine's carburettor or manifold. HHO Gas is 3 times more powerful than gasoline and is a fast growing trend for increasing performance and boosting Miles Per Gallon. The basic design is elegantly simple and efficient, and takes only minutes to assemble.

The newly launched <http://www.water4gasreview.com> website reviews the leading water car system water4gas. Rising gasoline prices are an issue that the entire world deals with on a day to day basis. The water4gas system allows any car to run on both water and gasoline. Through using the system it is possible to increase mileage by up to 50%, and save thousands of dollars a year on gasoline costs. Further to this the system drastically reduces car emissions, and hence is extremely environmentally friendly.
