Cadac Group introduces Organice 2007 R2

The Cadac Group, a leading Microsoft Gold Certified Partner developing SharePoint based engineering document management solutions, announces the release of Organice 2007 R2.

/24-7PressRelease/ - HEERLEN, THE NETHERLANDS, January 10, 2008 - The Cadac Group, a leading Microsoft Gold Certified Partner developing SharePoint based engineering document management solutions, announces the release of Organice 2007 R2. This new Organice release provides numerous enhancements and new capabilities that will further improve the business of project driven engineering industries.

The new features and enhancements include:

- Support for (extremely) large lists;
- Viewer improvements;
- Extended CAD support;
- Additional language support;
- Improved document distribution

Support for (extremely) large lists

SharePoint is not capable of handling (extremely) large lists or document libraries in a user friendly way. In the new release, Organice introduces an intelligent mechanism that caches the list values locally and makes the (extremely) large lists immediately available to the user. This is for instance very beneficial when document libraries include very many items, or when for instance lookup lists are being used with very many values.

Viewer improvements

To open and view files without the native application, Organice uses an integrated viewer that supports over 250 file formats. This support now also includes Office 2007 file formats. Furthermore it is possible to compare two revisions of the same document in the viewer and see the changes. The viewer shows both what has been added and what has been removed. The compare functionality is very useful to get more insight in the revision history of documents.

Extended CAD support

Organice was one of the first solutions that integrated SharePoint with AutoCAD to provide full engineering document management functionality in SharePoint. In the new release of Organice, the support of CAD in SharePoint is extended with Autodesk Revit 2008, Bentley MicroStation V8 XM and BricsCad 8 support.

Additional language support

Organice 2007 R2 adds French, Finnish and Spanish to the language library, which means that even more customers around the world can use Organice in their native language. Organice now supports 7 languages: English, French, German, Italian, Dutch, Finnish and Spanish.

Improved document distribution

Organice Transmit is an optional module that can be used to distribute multiple documents to multiple recipients at once, specified per recipient. In the new release the user interface is improved and in the distribution matrix it is possible to swap between the axis (documents and recipients). The automatic send method (digital or on paper) is now directly linked to the recipient and the transmittal letter that is send to each recipient supports multiple languages. Furthermore it is now possible to see all open actions per transmittal and to update all tracking items connected to a transmittal at once.

Organice 2007 R2 will be available to customers from January 2008.

About Organice

Organice is a software suite for engineering document management and document control, and is fully based on Microsoft SharePoint. Organice helps project driven organizations to manage their project documentation and to control their document distribution and tracking. Organice is easy to use and instantly accepted by all users and immediately improves the business process and results of project driven organizations.
