IDV Solutions Releases Visual Fusion Server 3.0 a Comprehensive Visual Composite Application Platform

VFS goes beyond typical enterprise mashups to integrate with and extend Microsoft Office SharePoint Server 2007, connect to any data source or Web service, and empower users to create compelling, interactive, actionable composites of data and services focused on solving real business needs.

/24-7PressRelease/ - January 31, 2008 - IDV Solutions today released Visual Fusion Server 3.0 (VFS), the most comprehensive visual composite application platform in the market. VFS goes beyond typical enterprise mashups to integrate with and extend Microsoft Office SharePoint Server 2007 (MOSS), connect to any data source or Web service, and empower users to create compelling, interactive, actionable composites of data and services focused on solving real business needs.

The new release of Visual Fusion Server offers advanced spatial operations, a more robust styling engine, and a new Graphical User Interface (GUI) to manage and organize information layers. Not only leveraging key MOSS functionality such as Excel Services, Enterprise Search, the Business Data Catalog, and security, VFS also geospatially enables MOSS Libraries and Lists, combining this information with existing enterprise data stores, such as SQL Server and ArcSDE, Web services, and information feeds. The result is a holistic view of complementing information within a rich, intuitive environment, all on top of a Virtual Earth base map.

"A great deal of enterprise data sharing and collaboration is happening within the portal framework," said Ian Clemens, Chief Technology Officer for IDV Solutions. "Visual Fusion Server enables enterprises to capitalize on their data investments and make it available in the context of location and time, a primary way of organizing information."

Using Visual Fusion Server an organization can streamline everyday business processes by having the ability to integrate and leverage their robust databases into one web portal. VFS enhances an organization's success by providing comprehensive data management, with a consistent user experience, where users can explore new opportunities, reveal hidden value, and share original insights.

IDV Solutions provides visual composite application software that consolidates information in the context of location and time. With the Visual Fusion platform users can explore new opportunities, reveal hidden value, and share original discoveries.
