Files2Links Launches Affordable File Transfer Solutions for the Enterprise

Files2Links Appliance and On-Demand Solutions Deliver Ease-of-Use, Innovation, and Affordability to Businesses

/24-7PressRelease/ - SUNNYVALE, CA, March 04, 2008 -- Files2Links, a leading provider of enterprise file transfer solutions, today announced the availability of the F2L 1000 Series Appliance version 2.0 and F2L OnDemand Service version 2.0. The new solutions help businesses of all sizes transfer large files with the unique combination of ease-of-use, innovation, and affordability.

F2L 1000 Series Appliance

Deployed on premise, the F2L 1000 Series Appliance is an integrated hardware and software solution for sending, receiving, and sharing large files. It provides an alternative to email and FTP for sending large files to business partners and customers. The F2L 1000 Series Appliance is installed in less than 30 minutes, integrates with Microsoft Active Directory, and is painless to administer. The solution maintains an auditable log of every transaction and secures confidential information during transit ensuring compliance with industry regulations such as HIPAA, GLBA, and Sarbanes-Oxley. The F2L 1000 Series Appliance includes mission-critical features such as backup, disaster recovery, and anti-virus features at no additional cost. For end-users, the solution is 100% web-based and extremely easy to use. Most installations require absolutely no user training. "Files2Links delivers a large file transfer solution that is easy to administer and dead simple for end-users," said Colin Drain, IT Manager, Ridgeback IT Solutions. "Now, I no longer have end-users treating my Exchange Server like a file server."

F2L OnDemand Service

The F2L OnDemand Service provides the same industry-leading features and functionality as the F2L 1000 Series Appliance, but is delivered as a hosted service. As a result, the F2L OnDemand Service has a number of key advantages. The Service's single tenant hosting model ensures data security and resource availability. Further, since the Service is hosted by the Files2Links Datacenter, it includes guaranteed bandwidth for mission critical files and does not clog corporate networks during transfers. For IT managers, the F2L OnDemand Service is easy to configure and maintain. It also provides a migration path to growing companies that may require an in-house solution in the future.
