Mill Valley Naturopath Dr. Beverly Yates Announces Addition of Biotechnology to Health Care

ZYTO biotechnology enables healthcare providers to use the newest biotechnology that enables a computer to actually talk to a person's body. The information gathered is used by health care workers to make better recommendations for health.

/24-7PressRelease/ - MILL VALLEY, CA, April 25, 2008 - Dr. Beverly Yates, N.D., has announced the addition of ZYTO (tm) biotechnology to the health care services offered to clients at her naturopathic health care clinic.

The Naturopathic Family Health Clinic, Inc. is located at 141 Camino Alto, Ste. 1, in Mill Valley. Yates provides alternative health care services, and has recently added ZYTO technology to eliminate trial and error in the process of deciding on the best nutraceutical and nutritional supplements to get patients on the road to better health faster and often for lower cost.

ZYTO Corp. is a biotechnology company specializing in bio-information and bio-communication. Using the principles of biology, quantum science, galvanic skin response (GSR), and the science of information, ZYTO technology can facilitate meaningful communication between computers and living things, according to ZYTO Corp. founder and C.E.O. Dr. Vaughn R. Cook, OMD.

"We are excited about the addition of ZYTO technology to the services we offer," said Yates. "We are now able to perform a health scan and health assessment of the body and obtain the information we need to make the best recommendation to improve health. It is quick, easy to administer, and very effective."

The Naturopathic Family Health Clinic, Inc. is a naturopathic family practice specializing in food allergies, heart disease, diabetes, and pediatrics.

"Using the ZYTO technology helps us to make a more accurate recommendation to our patients. This enables us to help them improve their health quickly, and do it in a way that keeps health care costs down," said Yates.

The process is simple to administer with just one brief office visit. Clients simply place their hand on a sensor that is connected to a computer. In just a few minutes the results can be seen on a computer screen, and an assessment can be made, according to Yates.
