Las Vegas' Red Rock Fertility Center: A Combination of the Perfect Environment, the Most Advanced Medicine, Provides Optimal IVF Treatment

Red Rock Fertility Center's Eva Littman, MD, focuses on the optimal environment for embryo's along with latest technology available. Red Rock is the only Center in Nevada (and one of the few in the country) to offer the breakthrough Saturn Laser System that increases the accuracy of fertilization.

/24-7PressRelease/ - LAS VEGAS, NV, July 17, 2008 - With technology playing an ever-increasing role in assisted reproduction, Eva Littman, MD, of Las Vegas' Red Rock Fertility Center, offers her patients the only treatment in the State of Nevada — and one of the few in United States— employing the Saturn Laser System.

While the use of lasers as part of in vitro fertilization (IVF) treatment is not new, the Saturn Laser from Research Instruments in the United Kingdom recently received the approval of the federal government for use here.

What sets it apart from other lasers is that when it is used, all guesswork as to the correct position of the laser beam is eliminated through use of a "pilot" laser that guides the main laser. This accuracy helps greatly to ensure the safety of the egg.

Laser ablation is the partial removal of the zona pellucida, the strong outer membrane that forms around an egg and which must be penetrated by the sperm for successful fertilization. To increase IVF success, the zona is penetrated using a laser which facilitates implantation.

Dr. Littman says, "I understand how difficult it is to want a child and the effort that goes into repeated IVF procedures. We use the Saturn Laser to provide the optimal chance of success."

The Saturn Laser is part of a fertility practice where Dr. Littman has embraced and provided a green environment, not because it is trendy but because it creates the healthiest ambiance in which an embryo can thrive.

The air in the Red Rock Fertility Center is subject to a filtration system that renders it extremely sterile. A series of UV lamps will kill bacterium and viruses. There are special phones that automatically notify Red Rock Fertility Center staff if there is a power outage that might endanger the eggs being stored. The paint does not release any volatile organic compounds into the atmosphere.

"Just as the environment in which a child grows and matures is critical to that child's success in life, so is the environment in which IVF — or any type of fertility treatment — takes place. "

"In designing the Red Rock Fertility Center," Dr. Littman says, "we took this into account and have done everything that it is currently possible to create an environment for treatment that is safe. We use the very latest technology and, of course, we wrap all of this in a warm and small boutique practice where our patients will know how much we value them and understand their desire to be parents." Its a winning combination!!!

About TADMedia

Tadmedia is for public release of Medical and Dental experts in their field to inform the consumer on various procedures, and practioners. for further information please contact Tad Rey at tadmedi1@hotmail.com
