The new Rotomax tube working line by DBD Technology

Recognised quality and passion for innovation have allowed DBD Technology to achieve commercial success in the tube working and the orbital processing of pipes and solids sector with the new Rotomax line.

/24-7PressRelease/ - ITALY, July 18, 2008 - The Rotomax line can process tubes in standard steel, stainless steel, steel with high levels of alloys (e.g. 100 Cr6 for bearings), cast iron, alluminium, copper and braonze. The unit is based on the concept of a rotating head on which are mounted 4 tools for processing both ends of the piece that has been cut. The tube is fixed at the centre of the rotating head, while the rotating utensils carry out the various operations. Cutting and processing done using a head are carried out on the production line to obtain a finished piece that does not require end finishing working.

Typical Rotomax processing includes: cutting, cutting with inner/outer smoothing, cutting with double outer smoothing and inner turning.

The versatility of DBD Technology's Rotomax means it can also remove chips (facing, centering, boring, threading, milling, canalisation and channelling) and carry out deformation (deformation of shape at ends, tapering, pressing, marking and knurling). Rotomax has many sectors of use: rings for ball bearings, rollers for conveyor belts, pneumatic cylinders, hydraulic cylinders, car shock absorbers, axle boxes and various types of axles (subcontracting for the motor vehicle sector), processing centres and grinding of tubes, etc...
